                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a novel L-amino acid producing bacterium of genus Escherichia, modified to enhance L-amino acid production by enhancing the activities of a protein. The novel bacterium is useful for producing L-amino acid e.g. L-Thr, L-Val, L-Pro, L-Leu, L-Met and L-Arg, by cultivating the bacterium in a culture medium and collecting L-amino acid to be produced and accumulated from the culture medium. The present sequence represents a protein of the invention which causes increased L-amino acid production in E. coli
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel L-amino acid producing Escherichia bacterium, is modified to enhance L-amino acid production by enhancing the activities of protein capable of making bacterium to have enhanced resistance to L-amino acids.
                                                                                                                                                                                                                             Tumour-as

                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an L-amino acid producing bacterium belonging to the genus Escherichia, where the bacterium has been modified so that the L-amino acid production by the bacterium is enhanced by enhancing activities of proteins by transformation of the bacterium with DNA coding for protein or by alteration of an expression regulation sequence of the DNA on the chromosome of the bacterium. The L-amino acid producing bacterium is useful for producing L-amino acid by fermentation, including L-threonine, L-valine, L-proline, L-methionine, or L-arginine. The genes are useful for improving L-amino acid productivity. This sequence corresponds to the D2633 protein, one of the L-amino acid biosynthesis pathway proteins. The protein is a putative transport this protein increases production on L-threonine, L-valine, L-leucine, L-proline and L-methionine.

Also described is a method for producing (A) comprising cultivating the bacterium in a culture medium and collecting the produced and accumulated L-amino acid. The modified bacterium has the ability to grow on a minimal medium containing L-amino acid or its analog in a minimal concentration and ability to grow faster on a medium containing L-amino acid or its analog than the unmodified strain or the wild type strain, or the parental strain of the bacterium. The present sequence represents the E. coli b2683 protein which has L-amino acid excretion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1 MSYEVILLGILVGVANYCPRYLPLRLRVGNARPTKRGAVGILLDTIGIASICALLVVSTA 60

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention describes a new isolated nucleic acid encoding a Klebsiella pneumoniae polypeptide. Also described are: a recombinant expression vector comprising the nucleic acid, operably linked to a transcription regulatory element; and a cell comprising the recombinant expression vector. The nucleic acid is useful for preparing a vaccine composition against Klebsiella pneumoniae. This is the amino acid sequence of a Klebsiella pneumoniae polypeptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New nucleic acid encoding a Klebsiella pneumoniae polypeptide, useful for preparing a vaccine composition against Klebsiella pneumoniae.

ANK54951 to AAK64702 encode the human immune/haematopoietic antigen (I)
amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic
activity, and can be used in gene therapy and vaccine production. (I)
proteins and polynucleotides may be used in the prevention, diagnosis and
treatment of diseases associated with inappropriate (I) expression. For
example, they may be used to treat disorders associated with decreased
example, they may be used to treat disorders associated with decreased
that affect the activity of (I) by expressing inactive proteins or to
supplement the patients own production of (I). Additionally, (I)
polynucleotides may be used to produce the secreted (I), by inserting the
protein. (I) proteins and polynucleotides may be used to prevent,
diagnose and treat immune/haematopoietic-derived cells. AAK64703
to AAK87694 represent human immune/haematopoietic antigen genomic
sequences from the present invention. AAK54912 to AAK54950 and AAM82169
represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                               Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Acinetobacter baumannii; bacterial disease; antibacterial; vaccine; plant biocontrol agent.

                                                                                                                                                                                                                                                                             22
                                                                                                                                                                                                                                                                                       The invention relates to isolated Acinetobacter baumannii nucleic acids. The A. baumannii nucleic acids and polypeptides are useful as reagents for diagnosing a bacterial disease, as components of antibacterial vaccines, as targets for antibacterial drugs, to detect the presence of compounds for the ability to interfere with the A. baumannii in screening or to inhibit A. baumannii infection, and as biocontrol agents for plants. The present sequence represents the amino acid sequence of an A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Antisense; prokaryotic essential gene; cell proliferation; drug design.

The invention relates to an isolated nucleic acid comprising any one of
the 6213 antisense sequences given in the specification where expression
of the nucleic acid inhibits proliferation of a cell. Also included are:
(1) a vector comprising a promoter operably linked to the nucleic acid
nucleic acid; (2) a host cell containing the vector; (3) an isolated
continued a polypeptide whose expression is inhibited by the antisense
control or its fragment whose expression is inhibited by the
antisense nucleic acid; (4) an antibody capable of specifically binding
compressed or its fragment whose expression is inhibiting cellular
proliferation or the activity of a gene in an operon required for
confideration or the activity of a gene in an operon required for
confideration or that has an activity against a biological pathway
confideration or that has an activity against a biological pathway
creduired for proliferation or that inhibits cellular proliferation; (8)
identifying a gene required for cellular proliferation or the biological
confideration and proliferation confideration or the biological
confideration acts; (9) manufacturing an antibiotic; (10) profiling a
compound's activity; (11) a culture comprising strains in which the gene
compound's activity; (11) a culture comprising strains in which the gene
compound's activity; (11) a culture comprising strains in which the strains
compound sactivity; (11) a culture comprising strains in which the care
compound sactivity; (11) a culture comprising strains in which the
confideration of an organism. The antisense nucleic acids are useful for
confideration or an organism. The antisense nucleic acids required
confideration or screening for homologous nucleic acids required
confideration or screening for homologous nucleic acids required
confideration or screening for homologous nucleic acids required
confideration or definite proverses and security or confiderational
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Antisense; prokaryotic essential gene; cell proliferation; drug design.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                            (SLAT/
  the first antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a prodiferation of a cell. Also included are:

(2) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (3) an antibody capable of specifically binding polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation, (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiocit; (10) profilling a compound's activity; (11) a culture comprising strains in which the gene or which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiocit; (10) profilling a product is overexpressed or underexpressed; (12) determining the extent cowhich each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the extent cowhich each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the cultured proliferation of an organism. The antisense nucleic acids are useful for collection and activity is a content of the strains of solutions.

Compound's activity of a compound that inhibits the extent conditions or screening for homologous nucleic acids required for collection of an organism. The antisense mucleic acids required for all and antised that the strains or scr
                                                                                                                                                                                                  screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

provide for expression of a polynucleotide encoding a polypoptide from a provide for expression of a polynucleotide encoding a polypoptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant having an improved property. The plant is a crop plant such as maize or soybean. The method of producing a transformed plant having an improved property. The plant is a crop plant such as maize or soybean. The method of producing a transformed plant cauch as maize or soybean. The method of producing a plant with the recombinant DNA construct and growing the transforming a plant with the polynucleotide or polypeptide is useful for improving plants which improved plant properties, e.g. improved cold, heat or drought tolerance, colerance to heabloides, extreme osmotic conditions, pathogens or pests, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of homologous recombination, modified seed oil or protein yield and/or content, improved yield by modification of carbohydrate, nitrogen or providing improved plant growth and development under at least one stress providing improved plant growth and development under at least one stress
New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          90 LVSGSLAGVTSVPFTY-PLELIRVRLAFETKREGRSSLRSIIRQIYSENALTVPKNAPAS 148

 The invention relates to a human glucose transporter (GLUTX) protein. The protein can be expressed by standard recombinant methodology. GLUTX nucleic acids are useful as hybridization probes for detecting the presence of GLUTX DNA in a sample, useful for diagnosing conditions associated with aberrant expression levels of GLUTX. The GLUTX gene is also useful as a therapeutic agent for regulating translation of GLUTX mRNA, and for treatment of disorders associated with aberrant expression of GLUTX and aberrant hexose transport. It is useful for generating GLUTX geneific antibodies, identifying agonists and antagonists of GLUTX, and identifying nucleic acids in other species encoding nucleic acids conditions. Checknomosomal location of GLUTX, and as tissue specific markers.

Sequences AAY27287-291 represent different glucose transporter proteins which were compared with human GLUTX.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         novel mammalian transporter protein and the gene encoding it, are seful in the diagnosis and treatment of disorders associated with

The invention relates to a recombinant DNA construct comprising a provided for expression of a polynucleotide encoding a polypoptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a cransformed plant having an improved property. The plant is a crop plant cuch as maize or soybean. The method of producing a transformed plant with the ecombinant DNA construct and growing the transformed plant with the cereombinant DNA construct is useful for improving plant with the polynucleotide or polypeptide is useful for improving plant with the polynucleotide or polypeptide is useful for improving plants with construct is useful for improving plants with increased resistance to herbicides, extreme osmotic conditions, pathogens or polyance to herbicides, extreme osmotic conditions, pathogens or tolerance to herbicides, extreme osmotic conditions, pathogens or forment, improved yield by modified sead oil or protein yield and/or content, improved plant growth and development under at least one stress condition, improved lignin production of carbohydrate, nitrogen or providing improved lignin production of miproved galactonannan condition, improved lignin production of miproved galactonannan condition, improved lignin production of miproved galactonannan condition. This sequence represents a bacterial polypeptide used in the scope of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic form part of the printed specification but was obtained in electronic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             13.9%; Score 76.5; DB 8; Length 500; 25.2%; Pred. This invention describes novel human NOVX polypeptides which have cytostatic, cardiant, antiarteriosclerotic, antiastehmatic and hypotensive activity. Pharmaceutical compositions comprising the NOVX proteins or nucleic acid molecules or NOVX antibodies are useful for preventing or treating a disorder associated with aberrant NOVX expression or activity egg. cancer, hypertension, atherosclerosis, cardiomyopathy or bronchial asthma. The products of the invention can be used for gene therapy or in a vaccine. ABU65041-ABU65218 represent the NOVX polypeptides encoded by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Spytek KA, Shenoy SG, Taupier RJ, Pena CEA, Li L;

The invention relates to an isolated polypeptide (designated NOVX, or NOVI-NOVI27) comprising a sequence selected from 178 fully defined amino acid sequences (and their mature forms, variants and fragments). Also included are an isolated nucleic acid molecule encoding NOVX, a vector comprising the nucleic acid, a cell comprising the vector, methods for determining the presence or amount of the polypeptide or the nucleic acid molecule in a sample, methods for determining the presence of or predisposition to a disease associated with altered levels of expression of the above polypeptide or nucleic acid molecule in a first mammalian subject, a method for identifying an agent that binds to the above polypeptide or nucleic acid molecule in a first mammalian subject, a method for identifying a potential therapeutic agent for subject, a method for identifying a potential therapeutic agent for subject, a method for identifying a potential therapeutic and concernant care expression or physiological interactions of the polypeptide, a method of screening for a modulator of activity or of latency or predisposition to a pathology associated with the polypeptide and a method for modulating the activity of the polypeptide cited above. The composition and methods are useful for diagnosing, preventing or treating diseases such as are useful for diagnosing, preventing or treating diseases such as cachexia, cancer, neurodegenerative diseases, anorexia, cancer-associated cachexia, cancer, neurodegenerative diseases, inamened diseases, inamened diseases, inamened diseases, inamened diseases, these may also be used in dyslipidaemias, and other chronic diseases. These may also be used in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               uracil transporter-like protein - Arabidopsis thaliana
NyAlternate names: protein F1284.350
C;Species: Arabidopsis thaliana (mouse-ear cress)
C;Date: 20-Apr-2000 #sequence_revision 20-Apr-2000 #text_change 09-Jul-2004
C;Accession: T48383

Sequence 5531, Application US/09134001C

Sequence 5531, Application US/09134001C

GENERAL INFORMATION:
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO STAPHYLOCOCCUS

TITLE OF INVENTION: NUMBER: US/09/134,001C

TITLE OF INVENTION: NUMBER: US/09/134,001C

CURRENT APPLICATION NUMBER: US/09/134,001C

CURRENT FILING DATE: 1998-08-13

PRIOR APPLICATION NUMBER: US 60/064,964

PRIOR APPLICATION NUMBER: US 60/055,779

PRIOR PILING DATE: 1997-10-08

PRIOR PILING DATE: 1997-08-14

NUMBER OF SEQ ID NOS: 5674

SEQ ID NO 5331

LENGTH: 655

GERERAL INFORMATION:
Ratent No. 6610836
GENERAL INFORMATION:
RAPPLICANT: GATY Breton et. al
APPLICANT: GATY Breton et. al
TITLE OF INVENTION: WUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO KLEBSIELLA
TITLE OF INVENTION: PNEUMONIAE FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: 2709.2004001
CURRENT PAPLICATION NUMBER: US/09/489,039A
CURRENT FILING DATE: 1999-01-29
RIOR APPLICATION NUMBER: US 60/117,747
PRIOR FILING DATE: 1999-01-29
NUMBER OF SEQ ID NOS: 14342
SEQ ID NO 9330
LENGTH: 332

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 8247, Application US/09543681A

Sequence 8247, Application US/09543681A

Patent No. 6605709

GENERAL INFORMATION:
GENERAL INFORMATION:
TITLE OF INVENTION: DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION: DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION: UNGER: 1050-1002-001
CURRENT APPLICATION NUMBER: US/09/543,681A
CURRENT FILING DATE: 2000-04-05
PRIOR PEDICATION NUMBER: US 60/128,706
PRIOR SED ID NOS: 8344

SEQ ID NOS: 8344
                                                                                                                                                                                                                                                                                                                                                                      US-10-146-704-3

Sequence 3, Application US/10146704

Sequence 3, Application US/10146704

Patent No. 6828421

GENERAL INFORMATION:

APPLICANT: Myriad Genetics, Incorporated

APPLICANT: Myriad Genetics, Incorporated

TITLE OF INVENTION: VAMP-ASSOCIATED PROTEIN A-INTERACTING PROTEINS AND USE THEREOF

FILE REFRENCE: 1669.01

CURRENT APPLICATION NUMBER: US/10/146,704

CURRENT APPLICATION NUMBER: US 60/291,730

PRIOR APPLICATION NUMBER: US 60/291,730

PRIOR PILING DATE: 2001-05-17

NUMBER OF SEQ ID NOS: 3

Exceptichia coli CFT073

Excherichia coli CFT073

Bacteria: Proteobacteria: Gammaproteobacteria; Enterobacteriales;

Bacteria: Proteobacteria: Gammaproteobacteria; Enterobacteriales;

Bacteria: Proteobacteriales;

Bacteria: Proteobacteria: Bacherichia.

Status: A., Burland, V., Plunkett, G.D. III, Redford, P., Roesch, P., Stroud, D., Mayhew, G.F., Roes, D.J., Schout, S., Schwartz, D.C., Perna, N.T., Mobley, H.L.T., Donnenberg, M.S. and Blattner, F.R.

Extensive Moslas Structure Revealed by the Complete Genome Sequence of Uropathogenic Escherichia coli Proc. Natl. Acad. Sci. U.S.A. 99 (26), 17020-17024 (2002)

Droc. Natl. Acad. Sci. U.S.A. 99 (26), 17020-17024, Roesch, P., Resko, D.A., Burland, V., Plunkett, G.D. III, Redford, P., Roesch, P., Stroud, D., Mayhew, G.F., Rose, D.J., Zhou, S., Schwartz, D.C., Perna, N.T., Mobley, H.L.T., Donnenberg, M.S. and Blattner, F.R.

  The invention relates to a novel L-amino acid producing bacterium of genus Escherichia, modified to enhance L-amino acid production by enhancing the activities of protein. The novel bacterium is useful for producing L-amino acid e.g. L-Thr, L-Val, L-Pro, L-Leu, L-Met and L-Arg, by cultivating the bacterium in a culture medium and collecting L-amino acid to be produced and accumulated from the culture medium. The present sequence represents a gene of the invention which causes increased L-amino acid production in E. coli
  Novel L-amino acid producing Escherichia bacterium, is modified to enhance L-amino acid production by enhancing the activities of protein capable of making bacterium to have enhanced resistance to L-amino acids.

The invention relates to an L-amino acid producing bacterium belonging to the genus Escherichia, where the bacterium has been modified so that the L-amino acid producinon by the bacterium is enhanced by enhancing cutivities of proteins by transformation of the bacterium with DNA coding for protein or by alteration of an expression regulation sequence of the bacterium. The L-amino acid producing bacterium is useful for producing L-amino acid producing concluding L-threonine, L-valine, L-proline, L-methodnine, or L-arginine. The genes are useful for improving L-amino acid productivity. This sequence corresponds to the ygaM gene encoding protein b2683, one of the L-amino acid biosynthesis pathway proteins. The protein is a putative expression of this gene increases production on L-threonine, L-valine, L-proline, L-proline and L-methionine.

  The invention relates to an L-amino acid (A) producing bacterium (I) (belonging to the genus Bscherichia), which is modified to enhance the production of (A) by enhancing the activities of proteins (G) or (H) in a cell of (I). Also described is a method for producing (A) comprising cultivating the bacterium in a culture medium and collecting the produced and accumulated L-amino acid. The modified bacterium has the ability to grow on a minimal medium containing L-amino acid or its analog in a minimal concentration and ability to grow faster on a medium containing L-amino acid or its analog than the unmodified strain or the wild type strain, or the parental strain of the bacterium. The present sequence encodes the E. coli b2683 protein which has L-amino acid excretion

(HUMA-) HUMAN GENOME SCI INC

Rosen CA, Barash SC, Ruben SM;

WPI; 2001-483426/52.

Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis.

Disclosure, SEQ ID NO 25440; 3071pp + Sequence Listing; English.

AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I)
amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic
activity, and can be used in gene therapy and vaccine production. (I)
proteins and polynucleotides may be used in the prevention, diagnosis and
treatment of diseases associated with inappropriate (I) expression. For
example, they may be used to treat disorders associated with decreased
expression by rectifying mutations or deletions in a patient's genome
that affect the activity of (I) by expressing inactive proteins or to
cupplement the patients own production of (I). Additionally, (I)
cupplement diseases and concern and polynucleotides may be used to produce the secreted (I). by inserting the
nucleic acids into a host cell and culturing the cell to express the
protein. (I) proteins and polynucleotides may be used to prevent,
diagnose and treat immune/haematopoietic-related diseases, especially
cancers and cancer metastases of haematopoietic-derived cells. AAK64703
to AAK87694 represent human immune/haematopoietic antigen genomic
sequences from the present invention. AAK54942 to AAK84950 and AAM82169

Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis.

Claim 1; SEQ ID NO 2631; 3071pp + Sequence Listing; English.

and AMK54951 to AAK64702 encode the human immune/haematopoietic antigen (I) amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) proteins and polymucleotides may be used in the prevention, diagnosis an treatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of (I) by expressing inactive proteins or to supplement the patients own production of (I). Additionally, (I) Claim 2; SEQ ID NO 7593; 1205pp; French.

```
polynucleotides may be used to produce the secreted (I), by inserting the nucleic acids into a host cell and culturing the cell to express the protein. (I) proteins and polynucleotides may be used to prevent, diagnose and treat immune/haematopoietic-related diseases, especially cancers and cancer metastases of haematopoietic-derived cells. AAK64703 sequences from the present invention. AAK5492 to AAK54950 and AAM32169 represent sequences used in the exemplification of the present invention

                         The invention relates to the isolation of genes and their encoded proteins from Photorhabdus luminescens. The isolated sequences are sources of probes and primers for detecting the genome of P. luminescens and related species; to study polymorphisms; for gene analysis and for detection/amplification of the genes. Antibodies (Ab) raised against the polypeptides encoded by the genes are used for detection/identification of P. luminescens, e.g. in foods. The genes, proteins. Ab and cells that carry a gene-containing vector are used to select compounds that animals or microorganisms other than P. luminescens and are able to alter response or sensitivity to toxins and antibiotics produced by P. Combinant production of the proteins, particularly toxins and antibiotics and fungicides. The combinant production of the proteins, particularly toxins and cantibacterials useful as insecticides, bactericides and fungicides. The genes, proteins useful as insecticides, bactericides and fungicides. The care sensitive to P. luminescens encoded toxins or antibiotics) and as biopesticides. Other uses of the genes and the proteins are as virulence factors and for identifying targets of human diseases for which P. Luminescens is a model (particularly plague and whooping cough). This

containing many identical probes. The probes are nucleotide sequences of 30-80 bases, are prepared ex situ from synthetic oligonucleotides and at least to bases identical with, or complementary to, a segment of an least 20 bases identical with, or complementary to, a segment of an open reading frame (orf) of Escherichia coli K12. The biochip is used for specific detection of gene expression in K12 and for determining the gene expression pattern, e.g. for diagnostic determination of which E. coli strains are present in the gut, and to determine the effects of e.g. growth media on gene expression. The biochip provides as comprehensive as possible detection of the K12 genome, with simultaneous analysis of many different genes with a single device, and comparison of gene expression between K12 and its mutants or other E. coli strains in a single experiment. Apart from qualitative and quantitative information agency servession, it also allows measurements of population densities for the various strains. The use of synthetic oligonucleotides for preparation of probes allows free variation in probe length and ensures high purity (and thus selectivity, reactivity and reproducibility); also synthetic probes are generally shorter than probes prepared by polymerase chain reaction. ACD68731 to the contract than probes prepared by bolymerase chain reaction.
Escherichia coli K12, useful for detecting gene expression and expression
  This invention describes a novel biochip comprising probe spots, each

This invention describes a novel biochip comprising probe spots, each containing many identical probes. The probes are nucleotide sequences of 30-80 bases, are prepared ex situ from synthetic oligomucleotides and at least one includes a segment of at least 20 bases identical with, or complementary to, a segment of at least 20 bases identical with, or complementary to, a segment of an open reading frame (orf) of Escherichia CC in K12. The biochip is used for specific detection of gene expression in K12 and for determining the gene expression pattern, e.g. for and to determine the effects of e.g. growth media on gene expression. The biochip provides as comprehensive as possible detection of the K12 and to determination of which E coli strains are present in the gut, cannot comparison of gene expression between K12 and its mutants or other E coli strains in a single experiment. Apart from qualitative and quantitative information densities for the various strains. The use of synthetic oligomucleotides for preparation of probes allows free contract than probe length and ensures high purity (and thus sealectivity, reactivity and reproducibility); also synthetic probes are generally shorter than probes prepared by polymerase chain reaction. The present sequence is the promoter of the Escherichia coli multidrug transporter protein gene emrR. The promoter can be used in the method of the invention for identifying a DNA molecule that encodes a natural product having bloactivity, or a protein involved in the production of the natural product. The method involves: (a) providing a transformed a bacterial cell comprising (i) a gene fusion encoding a reporter protein product, and (ii) an exogenous DNA that encodes the natural product or the protein involved in production of the natural product or the transformed bacterial cell under conditions that permit product or the natural product; and (i) detecting the presence of the reporter protein protein involved in production of the natural product; and (c) detecting the presence of the reporter
  Identifying a DNA molecule that encodes, or a protein involved in the production of, a natural product having bioactivity by incubating the transformed bacterial cell under conditions that permit the production of

screening New antisense nucleic acids, useful for identifying proteins or screfor homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.

Claim 14; SEQ ID NO 27599; 1766pp; English

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the mucleic acid inhibites proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid cancilled an isolated by the nucleic acid; (2) an isolated by the antisense nucleic acid; (3) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (5) thibiting cellular proliferation or the activity of a gene in an operon required for proliferation or that has an activity against a biological pathway required for triat has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a product is oversypressed or underexpressed; (12) determining the extent or organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the test compound that inhibits proliferation of an organism. The antisense nucleic acids are useful for towhich each of the strains is present in a culture or collection of strains is proliferation of an organism. The antisense nucleic acids are useful for identifying proceases, or for screening honologous nucleic acids required for proliferation in calls other than S. aureus, S. typhimurium, C. prokaryotic essential genes. Note: The sequence is one of the target for proliferation in calls other than S. aureus, S. typhimurium, C. prokaryotic essential genes. Note: The sequence is one of the target for the printed specification, but was obtained in call and the sequence is one of the printed proliferation of the printed specification of the printed specification of the printed spe ftp.wipo.int/pub/published\_pct\_sequences

//done library was
CONSTRUCTED from limilion independent clones. CDNA
synthesis was initiated using an oligo(dT) primer, using
methylated C in the first strand synthesis reaction.
// Following this first strand reaction, double-stranded
was blunted, ligated to NotI adapters, digested with
CCORT, size-selected, and cloned into the NotI and ECORI
compatible sites of a custom modified MCS of the
pBluescript (KS+) vector. The library was normalized in 2
rounds using conditions adapted from Soares et al., PNAS
(1994) 91: 9228-9232 and Bonaldo et al., Genome Research 6
(1996): 791, except that a significantly longer
reannealing hybridization was used."

/note="Vector: palledescript II SK+; Site 1: BCORI; Site 2: XhoI; The CDNA library was constructed from mRNA isolated germinating shoots of the cultivar Williams. The seeds were allowed to germinate for 24 hours prior to being cold stressed for 2 days at 4C. Complementary DNA was synthesized from mRNA using a primer consisting of a poly(dT) sequence with a XhoI restriction site. EcoRI adapters were ligated to the blunt-ended cDNA fragments followed by XhoI digestion. The CDNA fragments were directionally cloned into the EcoRI-XhoI restriction site of the pBluescript vector. The ligated cDNA fragments were transformed into DH10B host cells (GibcoBRL). This library was constructed in the laboratory of Dr. Randy
  BB844978 RIKEN full-length enriched, adult male kidney Mus musculus CDNA clone F520002L02 5', mRNA sequence.

/note="Organ: Eye; Vector: pCMVSport6; RNA was extracted
from pooled 15day post-hatched chicken eye. A
directionally cloned cDNA library in the pCMVSPORT6 vector
(Invitrogen) was constructed at Bioserve Biotechnology
(Laurel MD) essentially following the protocols of the
SuperScript Plasmid System, full details of which are
contained in the manufacturer's Instruction manual
(http://www.lifetech.com/). First strand synthesis was
carried out using a Not I primer-adapter
[5'-pGACTAGTTCTAGATCCGCAGCGCCCC(T)15-3']. cDNA was
cloned in Not I/Sal I sites. EST analysis was performed at
the NIH Intramural Sequencing Center (NISC). Analyzed data
available through http://neibank.nei.nih.gov."

  Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
